 - ▶ Dotted-Pair, Association & Property Lists
 - ▶ Lisp qua Procedural Languages

Relations – Definition

- ▶ A n -ary relation relates items drawn from sets

Relations – Definition

- ▶ A n-ary relation relates items drawn from sets
- ▶ The set of performer and tune can be defined by a relation

Relations – Definition

- ▶ A n-ary relation relates items drawn from sets
- ▶ The set of performer and tune can be defined by a relation
- ▶ A relation has two parts:

Relations – Definition

- ▶ A n-ary relation relates items drawn from sets
- ▶ The set of performer and tune can be defined by a relation
- ▶ A relation has two parts:
 - ▶ The sets in the relation X_1, X_2, \dots, X_n .

Relations – Definition

- ▶ A n-ary relation relates items drawn from sets
- ▶ The set of performer and tune can be defined by a relation
- ▶ A relation has two parts:
 - ▶ The sets in the relation X_1, X_2, \dots, X_n .
 - ▶ A "graph" over the tuples taken from the elements which maps each tuple to true or false: $G : X_1 \times X_2 \times \dots \times X_n \rightarrow \mathcal{B}$

Relations – Definition

- ▶ A n-ary relation relates items drawn from sets
- ▶ The set of performer and tune can be defined by a relation
- ▶ A relation has two parts:
 - ▶ The sets in the relation X_1, X_2, \dots, X_n .
 - ▶ A "graph" over the tuples taken from the elements which maps each tuple to true or false: $G : X_1 \times X_2 \times \dots \times X_n \rightarrow \mathcal{B}$
- ▶ E.g. Perhaps: $G(\text{rolling_stones}, \text{start_me_up}) \rightarrow \text{true}$

Relations – Definition

- ▶ A n-ary relation relates items drawn from sets
- ▶ The set of performer and tune can be defined by a relation
- ▶ A relation has two parts:
 - ▶ The sets in the relation X_1, X_2, \dots, X_n .
 - ▶ A "graph" over the tuples taken from the elements which maps each tuple to true or false: $G : X_1 \times X_2 \times \dots \times X_n \rightarrow \mathcal{B}$
- ▶ E.g. Perhaps: $G(\text{rolling_stones}, \text{start_me_up}) \rightarrow \text{true}$
- ▶ Note each performer has many songs, each song can have multiple performers

Functions – Definition

- ▶ Def'n: A function f is a *mapping*
 - ▶ from one set, D (the domain),
 - ▶ to another set, R (the range),
 - ▶ where f has **exactly one** value for **every** domain element

Functions – Definition

- ▶ Def'n: A function f is a *mapping*
 - ▶ from one set, D (the domain),
 - ▶ to another set, R (the range),
 - ▶ where f has **exactly one** value for **every** domain element
- ▶ Formally:
 - ▶ $f(d)$ defines **at least one** value: $\forall d \in D. \exists r \in R. f(d) = r$
 - ▶ $f(d)$ defines **at most one** value:

$$\forall d \in D. \forall r, s \in R. [f(d) = r \wedge f(d) = s] \Rightarrow r = s$$

Examples of Functions

- ▶ The age of a person is a function.
 - ▶ Formally: **age-of**(Mary)=15

Examples of Functions

- ▶ The age of a person is a function.
 - ▶ Formally: **age-of**(Mary)=15
- ▶ The address of a department is a function.
 - ▶ Formally: **birth-mother**(russ)=claire

Examples of Functions

- ▶ The age of a person is a function.
 - ▶ Formally: **age-of**(Mary)=15
- ▶ The address of a department is a function.
 - ▶ Formally: **birth-mother**(russ)=claire
- ▶ The square of a number is a function.
 - ▶ Formally: $3^2 = 9$

Example Functions as Maps

Function	Domain Set	Range Set
age-of	all persons	positive reals
birth-mother	all people	people
square	numbers	numbers

Functions and Non-functions

Are these examples functions?

Functions and Non-functions

Are these examples functions?

► Yes. Every d has an r (e.g. $\text{age-of}(d)$)

Functions and Non-functions

Are these examples functions?

Yes. Every d has an r (e.g. $\text{age-of}(d)$)

Functions and Non-functions

Are these examples functions?

Domain Range

- ▶ Yes. Every d has an r (e.g. $\text{age-of}(d)$)

Domain Range

- ▶ No. Exists d with multiple r (e.g. $\text{parent-of}(d)$)

Functions and Non-functions

Are these examples functions?

Domain Range

- ▶ Yes. Every d has an r (e.g. age-of(d))

Domain Range

- ▶ No. Exists d with multiple r (e.g. parent-of(d))

Domain Range

- ▶

Functions and Non-functions

Are these examples functions?

Domain Range

- ▶ Yes. Every d has an r (e.g. age-of(d))

Domain Range

- ▶ No. Exists d with multiple r (e.g. parent-of(d))

Domain Range

- ▶ No. Exists d with no r (e.g. sqrt(d))

N-ary Functions

- ▶ N-ary domain is the cross product of unary domains

N-ary Functions

- ▶ N-ary domain is the cross product of unary domains
 - ▶ The domain of positive integers is: $\mathcal{Z}^+ = \{0, 1, 2, 3, \dots\}$

N-ary Functions

- ▶ N-ary domain is the cross product of unary domains
 - ▶ The domain of positive integers is: $\mathcal{Z}^+ = \{0, 1, 2, 3, \dots\}$
 - ▶ The domain of integer pairs is:

$$\mathcal{Z}^2 = \mathcal{Z} \times \mathcal{Z} = \begin{bmatrix} (0, 0) & (0, 1) & \dots \\ (1, 0) & (1, 1) & \\ \vdots & & \ddots \end{bmatrix}$$

N-ary Functions

- ▶ N-ary domain is the cross product of unary domains
 - ▶ The domain of positive integers is: $\mathcal{Z}^+ = \{0, 1, 2, 3, \dots\}$
 - ▶ The domain of integer pairs is:

$$\mathcal{Z}^2 = \mathcal{Z} \times \mathcal{Z} = \begin{bmatrix} (0, 0) & (0, 1) & \dots \\ (1, 0) & (1, 1) & \\ \vdots & & \ddots \end{bmatrix}$$

- ▶ Each element of \mathcal{Z}^2 is a binary tuple

N-ary Functions

- ▶ N-ary domain is the cross product of unary domains
 - ▶ The domain of positive integers is: $\mathcal{Z}^+ = \{0, 1, 2, 3, \dots\}$
 - ▶ The domain of integer pairs is:

$$\mathcal{Z}^2 = \mathcal{Z} \times \mathcal{Z} = \begin{bmatrix} (0, 0) & (0, 1) & \dots \\ (1, 0) & (1, 1) & \\ \vdots & & \ddots \end{bmatrix}$$

- ▶ Each element of \mathcal{Z}^2 is a binary tuple
- ▶ Sum is a binary function mapping tuples $(z_1, z_2) \in \mathcal{Z}^2$ to elements in \mathcal{Z}

$$+ : \mathcal{Z} \times \mathcal{Z} \rightarrow \mathcal{Z}$$

Vector Functions

- ▶ **range** is the cross product of unary domains

Vector Functions

- ▶ **range** is the cross product of unary domains
 - ▶ The range of real pairs is:

$$\mathcal{R}^2 = \mathcal{R} \times \mathcal{R} = \begin{bmatrix} (-\infty, -\infty) & \dots \\ \vdots & \ddots \\ \vdots & (+\infty, +\infty) \end{bmatrix}$$

Vector Functions

- ▶ **range** is the cross product of unary domains

- ▶ The range of real pairs is:

$$\mathcal{R}^2 = \mathcal{R} \times \mathcal{R} = \begin{bmatrix} (-\infty, -\infty) & & \dots \\ & \ddots & \\ & & (+\infty, +\infty) \end{bmatrix}$$

- ▶ Each element of \mathcal{R}^2 is a binary tuple (r_1, r_2) where $r_1, r_2 \in \mathcal{R}$

Vector Functions

- ▶ **range** is the cross product of unary domains

- ▶ The range of real pairs is:

$$\mathcal{R}^2 = \mathcal{R} \times \mathcal{R} = \begin{bmatrix} (-\infty, -\infty) & & \dots \\ & \ddots & \\ & & (+\infty, +\infty) \end{bmatrix}$$

- ▶ Each element of \mathcal{R}^2 is a binary tuple (r_1, r_2) where $r_1, r_2 \in \mathcal{R}$
- ▶ The rectangular-to-polar-coordinates function, `aspolar`, maps \mathcal{R}^2 to radius-angle space $\mathcal{R} \times \Theta$

$$\text{aspolar} : \mathcal{R}^2 \rightarrow \mathcal{R} \times \Theta$$

Vector Functions

- ▶ **range** is the cross product of unary domains

- ▶ The range of real pairs is:

$$\mathcal{R}^2 = \mathcal{R} \times \mathcal{R} = \left[\begin{array}{ccc} (-\infty, -\infty) & & \dots \\ & \ddots & \\ & & & (+\infty, +\infty) \end{array} \right]$$

- ▶ Each element of \mathcal{R}^2 is a binary tuple (r_1, r_2) where $r_1, r_2 \in \mathcal{R}$
- ▶ The rectangular-to-polar-coordinates function, `aspolar`, maps \mathcal{R}^2 to radius-angle space $\mathcal{R} \times \Theta$

$$\text{aspolar} : \mathcal{R}^2 \rightarrow \mathcal{R} \times \Theta$$

- ▶ **NOTE:** for each element of the domain a vector function returns a exactly one tuple

Function Functions

- ▶ N-ary domain of objects

Function Functions

- ▶ N-ary domain of objects
- ▶ Range is the space of functions

Function Functions

- ▶ N-ary domain of objects
- ▶ Range is the space of functions
- ▶ Example: Machine Learning Neural Network
 - ▶ Domain: labeled set of examples and learning algorithm
 - ▶ Range: a function f that can be used to predict labels of unseen data
 - ▶ Mapping: learner : $\mathcal{D} \rightarrow \mathcal{R}$

Function Functions

- ▶ N-ary domain of objects
- ▶ Range is the space of functions
- ▶ Example: Machine Learning Neural Network
 - ▶ Domain: labeled set of examples and learning algorithm
 - ▶ Range: a function f that can be used to predict labels of unseen data
 - ▶ Mapping: learner : $\mathcal{D} \rightarrow \mathcal{R}$
- ▶ Sample Data point: ((5,1) (-2, -1) (3,1) (11,1) (-9, -1) (-20,-1))

Function Functions

- ▶ N-ary domain of objects
- ▶ Range is the space of functions
- ▶ Example: Machine Learning Neural Network
 - ▶ Domain: labeled set of examples and learning algorithm
 - ▶ Range: a function f that can be used to predict labels of unseen data
 - ▶ Mapping: learner : $\mathcal{D} \rightarrow \mathcal{R}$
- ▶ Sample Data point: ((5,1) (-2, -1) (3,1) (11,1) (-9, -1) (-20,-1))
- ▶ Sample Range value: $f(x) = \text{if } x > 0 \text{ return } 1 \text{ else return } -1$

Function Application Notation

- ▶ We say that “ f is applied to an argument of D to give a value in R .”

Function Application Notation

- ▶ We say that “ f is applied to an argument of D to give a value in R .”
- ▶ Ways of indicating function application:

Function Application Notation

- ▶ We say that “ f is applied to an argument of D to give a value in R .”
- ▶ Ways of indicating function application:
 - ▶ Infix notation: function name between arguments
General form: $a_1 \text{ fn } a_2$ (e.g. $5 + 7$)

Function Application Notation

- ▶ We say that “ f is applied to an argument of D to give a value in R .”
- ▶ Ways of indicating function application:
 - ▶ Infix notation: function name between arguments
General form: $a_1 \text{ fn } a_2$ (e.g. $5 + 7$)
 - ▶ Prefix notation: function name before arguments
General form: $\text{fn}(a_1, a_2, \dots)$
(e.g. $+(5, 7)$, $\text{distance-between}(\text{ottawa}, \text{edmonton})$)

Function Application Notation

- ▶ We say that “ f is applied to an argument of D to give a value in R .”
- ▶ Ways of indicating function application:
 - ▶ Infix notation: function name between arguments
General form: $a_1 \text{ fn } a_2$ (e.g. $5 + 7$)
 - ▶ Prefix notation: function name before arguments
General form: $\text{fn}(a_1, a_2, \dots)$
(e.g. $+(5, 7)$, $\text{distance-between}(\text{ottawa}, \text{edmonton})$)
 - ▶ Postfix notation: function name follows arguments
General form: $a_1, a_2, \dots \text{ fn}$ (e.g. $(5, 7) +$ "Reverse Polish notation")

Equivalence of Notations

- ▶ Notations are equivalent, though there are preferred conventions:

Equivalence of Notations

- ▶ Notations are equivalent, though there are preferred conventions:
 - ▶ $+(1, 2) \equiv (1 + 2) \equiv (1, 2)+$

Equivalence of Notations

- ▶ Notations are equivalent, though there are preferred conventions:
 - ▶ $+(1, 2) \equiv (1 + 2) \equiv (1, 2)+$
 - ▶ `grade-of(first-name,lastname)`
 \equiv first-name grade-of last-name
 \equiv first-name last-name grade-of

Image and Preimage

- ▶ Def'n: image of $d \in D$ under function f is the result $r \in R$

Image and Preimage

- ▶ Def'n: image of $d \in D$ under function f is the result $r \in R$
- ▶ Def'n: preimage or inverse of $r \in R$ under function f is the element(s) of $d \in D$ that result in r

Composing Functions

- ▶ Def'n: The application of a function to result of another function

Composing Functions

- ▶ Def'n: The application of a function to result of another function
- ▶ Notation: $f \circ g$, means f applied to result of g

Composing Functions

- ▶ Def'n: The application of a function to result of another function
- ▶ Notation: $f \circ g$, means f applied to result of g
- ▶ Note: Domain of outer function must accept result of inner function
 $\text{domain}(f) \supseteq \text{range}(g)$

Composing Functions

- ▶ Def'n: The application of a function to result of another function
- ▶ Notation: $f \circ g$, means f applied to result of g
- ▶ Note: Domain of outer function must accept result of inner function
 $\text{domain}(f) \supseteq \text{range}(g)$
- ▶ Given the factorial function $!$ and the sum function $+$, their composition is: $! \circ +$

Composing Functions

- ▶ Def'n: The application of a function to result of another function
- ▶ Notation: $f \circ g$, means f applied to result of g
- ▶ Note: Domain of outer function must accept result of inner function
 $\text{domain}(f) \supseteq \text{range}(g)$
- ▶ Given the factorial function $!$ and the sum function $+$, their composition is: $! \circ +$
- ▶ Example: $! \circ +(2, 3) = ![+(2, 3)] = ![5] = 120$ $! \circ +$ is a function taking two real numbers, and returning factorial if their sum $\in \mathbb{Z}^+$
