Philip Henderson and Ryan B. Hayward Probing the 4-3-2 Edge Template in Hex

< ロ > < 同 > < 回 > < 回 > .

Hex Basics

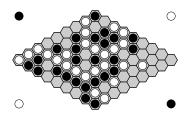

Rules

- Two players alternate turns playing on any empty cell
- Stones are permanent (no moving or capturing)
- Goal is to connect your two sides of the board

A 10

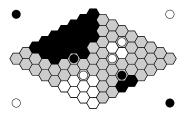

Hex Basics

Theoretical Properties

- An extra stone of your color is never a disadvantage
- First-player win: strategy-stealing argument
- PSPACE-hard to determine winner in arbitrary position

Virtual Connections

- Virtual connection (VC): a second-player strategy to connect two cells
- Carrier set: empty cells needed for a VC
- Edge template: VC where one endpoint is an edge
- Probe: a move into the carrier set of an opponent's VC

Background

Motivation Results

Summar

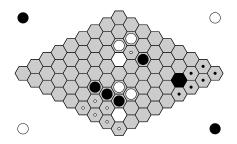

Fill-in

- Fill-in: stones that can be added to the board without changing its win/loss value
- Dead: fill-in that can be assigned to either color
- Captured: fill-in assigned to a particular player

・ 同 ト ・ ヨ ト ・ ヨ ト

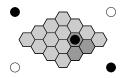

Domination

- A move is capture-dominated by another if the latter gets a superset of the fill-in
- No other forms of domination in Hex were known

・ロッ ・ 一 ・ ・ ・ ・ ・ ・ ・ ・

Bridge Edge Template

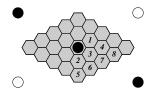

Bridge edge template:

- Captures both carrier cells
- Improves the VCs that can be found
- Helps solve Hex faster

< /₽ ▶

4-3-2 Edge Template

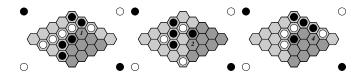

- 4-3-2 edge template is common
- Carrier not captured, but maybe some probes are inferior
- Pruning probes would improve Hex solvers and players

< 一 →

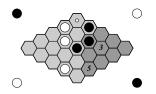

(*) * (*) *)

Unique Winning Moves

Probes 1, 2, 4 can be unique winning move
⇒ Probes 1, 2, 4 are not always inferior

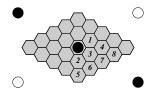

Other Probes

- Probes 3 and 5 can be only winning 4-3-2 probes
- Seems contrived: merely delays win by threatening a second winning path
- Probes 6, 7, 8 never identified as unique winning moves

・ 同 ト ・ ヨ ト ・ ヨ ト

- Conjecture: Probes 3, 5, 6, 7, 8 are always inferior moves
- Conjecture is still open
- Conjecture holds under certain constraints

< 回 > < 回 > < 回 >

Induced Path Domination

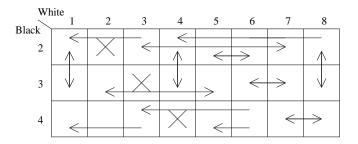

- One cell path-dominates another if the former appears on every minimal winning path that uses the latter
- Lemma: Path-domination implies move domination in Hex
 - Proof Sketch: If the path-dominated move wins, then use the same strategy for the path-dominating move replacing one cell with the other. The outcome must be identical since the path-dominated cell requires the other cell to contribute to a winning path.
- Mutual domination implies equivalence

Induced Path State Domination

Induced path domination/equivalence gives many state domination/equivalence results:

Conditional 4-3-2 Theorem

Using base cases:

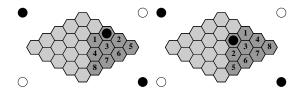

- Capture-domination
- Induced path domination

we can inductively show:

• **Theorem:** If probes 1 and 4 lose to maintenance of a 4-3-2 connection, then probes 3, 6, 7, 8 lose as well.

(*) * (*) *)

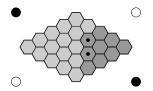

Acute Corner 4-3-2

- Lemma: For the A3 4-3-2, probes 2,3,5 are inferior
- Lemma: For the B3 4-3-2, probes 1,3,4,5,6,7,8 are inferior

▲ □ ▶ ▲ □ ▶ ▲

Acute Corner 4-3-2

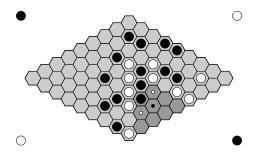

• **Theorem:** In the acute corner 4-3-2 region, two cells dominate all others

・ 戸 ・ ・ ヨ ・ ・ ヨ ・ ・

Summa

Multi-Move Domination

• **Theorem:** Given a Black 4-3-2, if giving White probes 1 and 2 in exchange for Black 3 is a White loss, then probes 1, 2, 3, 5, 6, 7, 8 all lose for White

・ロッ ・ 一 ・ ・ ・ ・ ・ ・ ・ ・

- Efficiently reduce moves to consider in both acute corners when solving or playing Hex
- Provide equivalent-value state transpositions within the solver database

- Edge templates are common, and provably pruning their probes is useful
- Induced path domination is a useful technique for proofs relating to Hex strategies
- Conditional move pruning can be done for all 4-3-2 edge templates
- Unconditional move pruning can be done for acute corner 4-3-2 edge templates

Future Work

- Weakening necessary conditions to prune 4-3-2 probes
- Resolving the (unconditional) conjecture
- Generalizing/automating this technique to other edge templates

Any Questions?

Thanks to:

- NSERC, Alberta Ingenuity, and iCORE for funding
- Broderick Arneson for related coding in our Hex Als and solver
- Referees for useful feedback
