PLUS REPLIES/SOL'NS

MATHEMATICAL GAMES

Concerning the game of Hex, which may be played on the tiles of the bathroom floor

by Martin Gardner

It is something of an occasion these days when someone invents a mathematical game that is both new and interesting. Such a game is Hex, introduced 15 years ago at Niels Bohr's Institute for Theoretical Physics in Copenhagen. Hex may well become one of the most widely played and thoughtfully analyzed new mathematical games of the century. It swept the Scandinavian countries in the middle 1940s, and in 1949 it was taken up by game theorists in the U. S. Later Claude E. Shannon and Edward F. Moore of the Bell Telephone Laboratories designed and built an analogue computer capable of playing a moderately good game of Hex.

supply of white pieces. The players alternately place one of their pieces on any one of the hexagons, provided the hexagon is not already occupied by another piece. The objective of "black" is to complete an unbroken chain of black pieces between the two sides labeled "black." "White" tries to complete a similar chain of white pieces between the sides labeled "white."

The chain may freely twist and turn; an example of a winning chain is shown in the illustration at the bottom of the page. The players continue placing their pieces until one of them has made a complete chain. The game cannot end in a draw, because one player can block the other only by completing his own chain. These rules are simple, yet Hex is a game of surprising mathematical subtlety.

Do you
think about
angular
acceleration?

does...

and uses Statham
Angular Accelerometers
to test...

- history
- draws are not possible
- $n \times n$ board: exists 1st-player-wins strategy
- $n \times (n-1)$ board: simple closer-sides-wins strategy
- variants, e.g. reverse hex

HEX

The Full Story

TIKEN

26. December 1942

Vil De lære Polygon?

Piet Hein har konstrueret et Spil, der med lige stor Glæde kan dyrkes af Skakeksperten og den, der blot kan holde en Blyant

„Politiken“ udskriver i Dag en Præmieopgave, der vil volds Hovedbrud for Begyndere

ten kan afbryde forbindelsen ved at besætte det mellemste gode Felt, dens Angrebsside bliver den Dykkernes Placering i den Vidtre Omegn. I det hele taget vider det sig snart nødvendigt at læse en større Del af Spillebrettet med Blyant.

En anden Erfaring, som kommer senere, men som man kan lide Spillet Begyndelse ved at se, er at det befaler sig at begynde i hvert Fald nogenlunde paa Midten. En rimelig, men paa ingen Maade nødvendig Aabning af Spillet er denne:

Paa Spillebrettet i Midten er Hvid begyndt i Midterfeltet. Se, har Sort sat i Kontaktfeltet til det ned imod Midten af Hvids Front og derved gjort to nyttige Felter, som staar i Vinkelstilling til Midterfeltet, usikre. Hvid har ogsaa vaegt et Felt i Kontakt med sin første. Og nu svarer Sort med at besætte et Vinkelfelt, som vilde være meget nyttigt for Hvid. Hvor skal nu Hvid sætte? Der er forskellige gode Muligheder.

Saadan er dette Spil nu begyndt. Nu kan enhver fortsætte. Det er ogsaa Hvids Tur. Man skal ikke være uspekulerende fra Begyndelsen. Der er ingen bedre Vej til at lære Spillet end at spille det.

Det er nyttigt at se skiftevis offensivt og defensivt paa Situationen, d. v. s. skiftevis se paa sine egne og Modstanders

POLYGON – SPILLEBRÆT

5 × 5

22. 1. 43.

Kæm J.L.! En det meget vord,
saa benyt det. Det er
jo ellers meget nok
at lave en lille
vennemæssig
Opgave!

z

Denne Opgave begynder hvid-og rødt, men først efter
15 Træk og under skadige Træk fra røde Side.
Jeg har prøvet adskillige (men ikke alle!) andre Mø-
ligheder for hvids første Træk, men har kun Gang
fundet et Modstrik fra røde Side.

WINNING 1ST-MOVES 2014 PH

- no draws
- $n \times n$ hex, $n \geq 1$ 1st-player
exists winning strategy
- $n \times m$ hex, $1 \leq n < m$ joins-closer-edges player
explicit winning strategy
- who wins arbitrary positions ? P-space complete

JOINS-CLOSER-EDGES STRATEGY

JOINS-CLOSER-EDGES STRATEGY

JOINS-CLOSER-EDGES STRATEGY

classic hex problems: strategies

for 10×10 board:

find win/loss value of all 50 opening moves

so far: wins b9,e6 (on main diagonal), losses a1,a2

for $n \times n$ boards with $n \geq 11$:

find a 1st-player winning strategy ?

find a winning 1st move ?

1st-move: short-diagonal-centermost always wins ?

dark Hex, a.k.a. Kriegspiel Hex

- each player sees only their stones
- on a turn, private conversation with referee:
can I move here?
if yes: that is your move
if no (opponent stone there): try again . . .

- 3×3 center opening:
has wins-with-probability-1 strategy
- 3×3 other openings: minimax strategy known
(maximize your minimum expected win-rate,
over all possible opponent strategies)

rex, cylindrical hex, Y

- rex (reverse hex)
to lose? join your sides
- cylindrical hex (play on soup can label)
to win? encircle or join top-bottom
- Y (3-sided board)
to win? join all 3 sides

CLOBBER

CLOBBER

CLOBBER

CLOBBER

CLOBBER

CLOBBER

CLOBBER

clobber

- 2-player game, Nowakowski et al.
- black/white checkers on a checkerboard
- on a turn, clobber an adjacent opponent checker
(you move, they leave)
- to win: make the last move

clobber problems

- linear clobber, starting config $oxoxox \dots ox$,
prove 1st player wins

boxoff

- 1-player game, Steven Meyers
- colored stones on a checkerboard (rectilinear)
- on a turn, remove any 2 same-colored stones that are the opposite corners of a rectangle (or opposite ends of a line segment) containing no other stones
- to win, remove all stones
- 5-colors (or more) boxoff is NP-complete

boxoff problems

- 2-color boxoff: in P?
