Impact

- Babyboomer after the WWII, generation X late 60s.
- I have the incline to call the last generation: **generation Internet** due to the impact on their lives.
- A teenager is buying his first CD on-line.
- A grandmother is e-mailing her friends around the world using her television.
- The Internet has a profound impact not only on the new generation, but on all people off all ages where ever they are.

Course Content

Internet and WWV

- Protocols
- · HTML and beyond
- Animation & WWW
- Java Script
- Dynamic Pages
- Perl
- Java Applets

- Databases & WWW
- SGML / XML
- Managing servers
- Search Engines
- Web Mining
- CORBA
- Security Issues
- Selected Topics
- Projects

Objectives of Lecture 2 Internet and WWW

- Get a brief overview of the history of the Internet and the different tools that exist on the Internet;
- Understand the distinction between the Internet and the World-Wide Web.

- The Memex machine: the dream will come true
- Hypertext: linking new kinds of documents
- The Internet: infallible information exchange
- The World-Wide Web and the start of a new era
- Web-based applications
- Some terminology

Web Technologies and Applications

University of Alberta

When Did It All Start?

- In 1945, Vannevar Bush wrote an article "As We May Think" describing a machine, Memex, containing human collective knowledge organized with "trails" linking materials of the same topic.
- The article revolutionized information technology before even the existence of modern computers.

Where is the memex?

- Memex is hypothetical machine.
- The information stored ought to be accessible.
- We haven't fulfilled the dream yet.
- But much has been achieved in 50 years.

Outline of Lecture 2

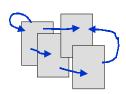

- The Memex machine: the dream will come true
- Hypertext: linking new kinds of documents
- The Internet: infallible information exchange
- The World-Wide Web and the start of a new era
- Web-based applications
- Some terminology

Hypertext-Hyperlink-Hypermedia

- Following Memex idea, Ted Nelson developed the Xanadu project which aimed at placing the entire world's literary corpus on-line.
- Ted Nelson coined the term *hypertext* in 1965.

A document is not contiguous but is a set of connected parts of documents. Hyperlinks are links that connect subdocuments. Hypermedia is a multimedia hypertext document,

ARPAnet

- In the heart of the cold war, ARPA (Advanced Research Projects Agency) was created (1957). The purpose was to outrun the Russians in the race for mastering rocket launching.
- In 1969, it was decided to link sensitive computer centres by a
 network in order to withstand a possible nuclear attack. The
 idea was to allow centres to communicate even after a centre is
 destroyed. (Bob Taylor's idea)
- It connected government labs, major research centres and universities.
- It existed until 1988 and was officially dismantled in 1990.
- Backbone Network speed: 64Kbits/second
- Major achievements:
 - TCP/IP, Domain Name Service, e-mail (SMTP), FTP, Telnet...

NSFnet

- DARPA, the Defense Advanced Research Projects Agency, still exists and the military have their own network but the original ARPAnet was integrated into the current Internet.
- The National Science Foundation in the USA funded the NSFnet which was created in 1985.
- Backbone Network speed: T1 (1.5mb/sec.) to T3 (45mb/sec.)
- It originally connected 5 major universities with supercomputer centres, but rapidly included other universities, research centres and private companies.
- Replaced ARPAnet as the backbone of Internet in 1990

What about the Internet?

- The Internet didn't originate in the USA alone.
- Other networks existed in North America and Europe and other places in the world.
- BitNet, for instance, connected many research centres and universities.
- Bridges connected these networks to create a larger international network: the Internet.
- Late 90s: Internet2, funded by US universities, a sequel to NSFnet with new protocols.

Advent of the World-Wide Web

- In 1990, Tim Berners-Lee developed a on-line hypertextbased system to help researchers at CERN in Switzerland share information across a diverse computer network.
- He came up with first versions of HTML (based on SGML) and the HTTP protocol.
- HTTP and HTML catapulted the Internet to new heights.
- The WWW revolutionized the use of the Internet thanks to a multimedia user friendly interface: a web browser.
- Mosaic was developed in NCSA by students at the University of Illinois in 1993, among them Marc Andreessen who created Netscape in 1995.

Web Technologies and Applications

University of Alberta

The WWW is not alone

- There are other tools on the Internet. They could be classified as:
 - Command Line. Ex: FTP (1971)
 - **Menu-based**. Ex: gopher (1991)
 - Search engine. Ex: WAIS (1991)
 - **Hypermedia**. Ex: WWW (1991)

Other Taxonomy of Internet Tools

- Communication services
 - E-mail, newsgroups (usenet), telnet, internet relay chat (IRC), ...
- Information storage and exchange
 - FTP, Gopher, Alex, ...
- Information Indexing
 - Archie, Veronica, Wais, UCSTRI, Whois, ...
- Interactive Multimedia information delivery
 - WWW and its indexes.

Terms in the Glossary

- Internet: group of networks connected together. The Internet refers to the global connection of networks around the world.
- LAN: Local Area Network: a group of computers, usually all in the same room or building, connected for the purpose of sharing files, exchanging email, and collaboration.
- Intranet: internal company network. Internal use of web capabilities.
- Extranet: ability to securely connecting the intranet with defined external networks.
- CGI: Common Gateway Interface: means of developing application for the web on the server side.
- Middleware: a tier usually between a web application or a web server and a database or another application layer.
